**Secular Trends**

**Demographics.** Population aging in advanced economies — and in Brazil itself — tends to reduce potential growth by slowing the expansion of the working-age population. Additionally, it exacerbates fiscal imbalances and ideological polarization, increasing the risk of financial and political instability. The baseline scenario assumes no major disruptions, partly because the world is still experiencing a reasonably synchronized monetary easing cycle. Nevertheless, this remains an important risk factor to monitor.

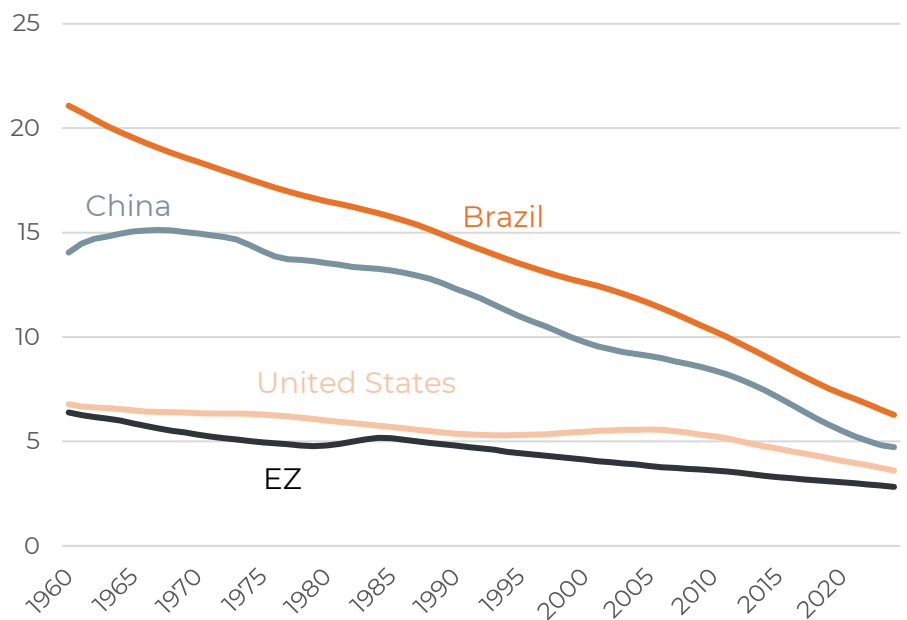

**Nature:** Global warming and climate variability may generate extreme events and supply shocks, with potential impacts on production and prices, especially commodities. The scenario does not incorporate a major disruptive event, but this remains a relevant risk factor.

**Technology:** Artificial intelligence is reshaping production and consumption patterns, already generating productivity gains and supporting high non-inflationary growth rates, especially in the United States. The wealth effect generated in equity markets contributes to a favorable outlook for global growth in 2026.

**Geopolitics:** China’s rise as a global economic power has triggered reactions from the United States. Deglobalization and realignment of forces and spheres of influence are underway worldwide. Russia is a declining power, although still militarily strong. The war in Ukraine is already priced in. The moderation of Donald Trump’s rhetoric compared to 2025 — especially toward Brazil — has reduced perceived international policy risk.

**Chart1: Dependency Ratio (Working Age Population / NonWorking Age Population)**

**International**

**Crescimento mundial:** Uncertainty surrounding U.S. economic policy has been offset by strong technological innovation, improving the outlook for global economic growth relative to last year. U.S. tariff policy and the depreciation of the dollar in international markets have been less inflationary than expected for global prices or interest rates, supporting a constructive scenario view.

**China.** Further deepening of the slowdown driven by internal contradictions of its growth model: excess capacity, high debt (especially in real estate sector), structural weakness in domestic consumption, aging population, and weakening rural-to-urban migration. Added to this are U.S. efforts to limit China’s economic, political and technological influence. Local deflation helps reduce price pressures globally.

**Commodities.** The downward cycle in international prices of agricultural and energy commodities appears to have ended in 2025, making inflation convergence toward targets more difficult in Brazil and the United States. No significant upside impulse is expected for Brazil’s key export commodities: oil, soybeans and iron ore. Regarding iron ore, the start of production at the Simandou mine — the world’s largest mining project, located in Guinea and led by Chinese state-owned consortia — may help keep prices contained.

**The US.** Growth is expected to moderate somewhat due to lagged effects of past monetary tightening and uncertainties related to economic policy decisions (combative rhetoric toward trading partners). Inflationary pressures (tariffs and dollar depreciation) tend to limit room for interest-rate cuts in 2026. The environment still points to a weaker U.S. dollar, which should reverse only when the difficulty of sustaining an optimistic inflation and low-rate scenario becomes clearer.

**Chart 2. DXY / USD – Currencies vs. USD (Euro 57.6%, Yen 13.6%, Pound 11.9%, Canadian Dollar 9.1%, Swedish Krona 4.2%, Swiss Franc 3.6%)**

**Politics and Regulation**

**2026 Elections:** Financial asset prices are expected to react increasingly to changes in expectations regarding the economic platform likely to win the 2026 election, potentially impacting the currency and short-term growth. The main concern is public debt sustainability. The scenario assumes the issue will be addressed, albeit timidly, insufficient to significantly improve current perceptions.

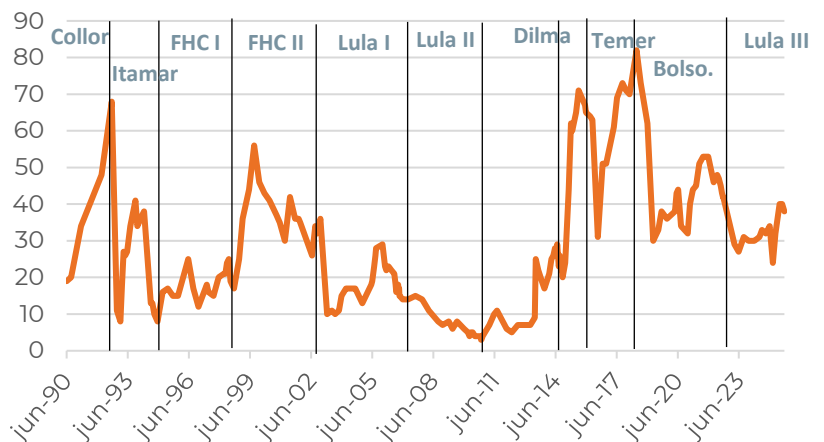

**Legislative Activity:** The government will continue attempting to contain fiscal deterioration by increasing revenues. At the turn of the year, important measures were approved, such as: creation of a framework to identify and punish habitual tax defaulters, a 10% cut in tax incentives, higher taxation on betting companies and fintech, The 2026 Budget Law was approved by Congress and sanctioned by the president, setting a surplus target of BRL 34.2 billion, although a more realistic projection points to a BRL 50 billion deficit.

**Legislative Agenda:** Congressional activity will focus on elections. The government will push to end the 6x1 workweek, while the opposition will seek visibility through the INSS CPI and investigations into the Banco Master scandal. Congress must also ratify the EU–Mercosur agreement. Actions by the Supreme Federal Court should be monitored, especially the advancement of an ethics code, considered the minimum necessary to prevent further deterioration in institutional trust.

**Structural Reforms:** The proximity of presidential elections makes it difficult to approve reforms in 2026. The main economic topic will be the regulation of the tax reform, whose effects will only be fully felt from 2032 onward, after the transition period. The post-election agenda should include: An Administrative Reform (especially addressing spending cap loopholes), a new round of Pension Reform (indexation of benefits) and a reform of the so-called Fiscal framework, adopted in substitution of the Spending Ceiling framework.

**Local Economy**

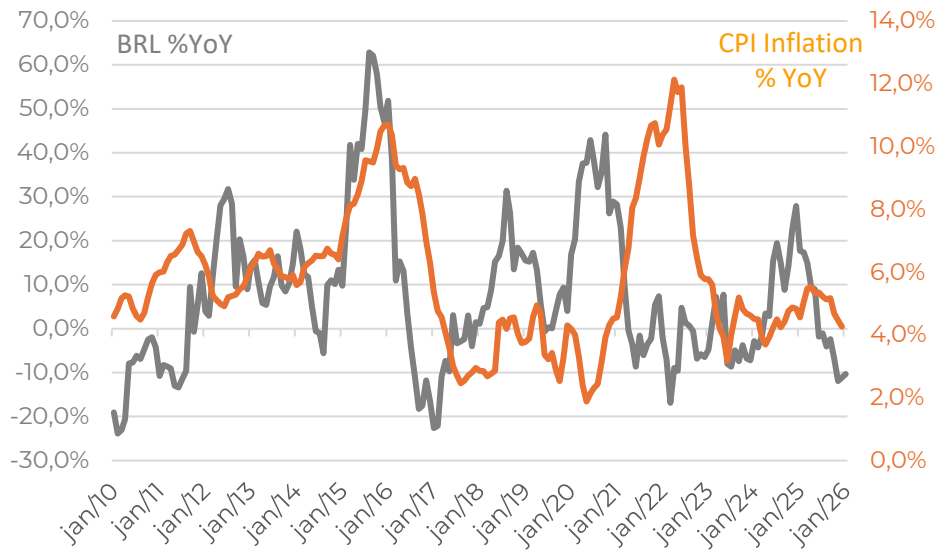

**FX:** High interest rates in Brazil and dollar depreciation abroad favor real stability at more appreciated levels than last year’s average. This variable is extremely sensitive to financial market sentiment. Changes in the international environment or market tolerance toward fiscal prospects could reverse recent trends. We believe the exchange rate will return to around BRL 5.40 to USD in 2026 due to increasing political uncertainties.

**Inflation and Interest Rates:** An economy trending toward slowdown, stable commodities and a strong real support a bearish outlook for the policy rate. The Central Bank has signaled the intention to begin cutting the Selic rate in March. The two main risks are: 1) U.S. Monetary Policy: Inflation rebounds could force a reversal of rate cuts, which would increase uncertainty and put pressure on the exchange rate. 2) Fiscal Expansion: Faster spending growth could fuel inflation through demand, currency depreciation and country risk.

**Current Account:** The current account deficit has increased worryingly, approaching the level of foreign direct investment inflows. This increases dependence on more speculative, short-term capital flows, making the exchange rate particularly vulnerable to shifts in investor sentiment.
